GRANT/ CLINICAL TRIALS RESEARCH SUPPORT FROM: BAYER, VASCULAR DYNAMICS, NOVO NORDISK,

Updated Definition of Apparent Resistant Hypertension

- Failure to reach goal BP <130/80 mm Hg

The MAJOR DIFFERENCE in Apparent RHTN you are trusting them taking the meds. In True RHTN you documented they are taking the drugs

True Resistant Hypertension

- Failure to reach goal BP <130/80 mm Hg while documenting ingestion of three-drug antihypertensive regimen including an appropriate diuretic for kidney function, a CCB and a RAS blocker maximally dosed

Two Most Common Non-Disease Causes for Apparent Resistant Hypertension

- White Coat Hypertension (Anxiety)
- Poor Medication Adherence

ALL the Following Need to be Present Before Diagnosing Someone as Having TRUE Resistant Hypertension

1. Adherence with: Low Sodium Diet Intake and Medication
2. Good Sleep Quality (i.e., minimum of 6-7 hours of uninterrupted sleep a night)
3. Substitutions of drugs with greater effect within the Same Class i.e. ARBs and diuretics
4. Rule out all Secondary Causes of Hypertension

Before saying anyone is resistant must rule out the most common secondary cause of hypertension:

PRIMARY ALDOSTERONISM

Best Proven Nonpharmacologic Interventions for Prevention and Treatment of Hypertension

	Nonpharmacologic Intervention	Dose	Hypertension	Normotension
<i>Physical activity</i>	Aerobic	<ul style="list-style-type: none"> ● 90-150 min/wk ● 65%-75% heart rate reserve 	-5/8 mm Hg	-2/4 mm Hg
	Dynamic Resistance	<ul style="list-style-type: none"> ● 90-150 min/wk ● 50%-80% 1 rep maximum ● 6 exercises, 3 sets/exercise, 10 repetitions/set 	-4 mm Hg	-2 mm Hg
	Isometric Resistance	<ul style="list-style-type: none"> ● 4 x 2 min (hand grip), 1 min rest between exercises, 30%-40% maximum voluntary contraction, 3 sessions/wk ● 8-10 wk 	-5 mm Hg	-4 mm Hg
<i>Healthy diet</i>	DASH dietary pattern	Diet rich in fruits, vegetables, whole grains, and low-fat dairy products with reduced content of saturated and total fat	-11 mm Hg	-3 mm Hg
<i>Weight loss</i>	Weight/body fat	Ideal body weight is best goal but at least 1 kg reduction in body weight for most adults who are overweight	-5 mm Hg	-2/3 mm Hg
<i>Reduced intake of dietary sodium</i>	Dietary sodium	<1,500 mg/d is optimal goal but at least 1,000 mg/d reduction in most adults	-5/6 mm Hg	-2/3 mm Hg
<i>Enhanced intake of dietary potassium</i>	Dietary potassium	3,500-5,000 mg/d, preferably by consumption of a diet rich in potassium	-4/5 mm Hg	-2 mm Hg
<i>Moderation in alcohol intake</i>	Alcohol consumption	In individuals who drink alcohol, reduce alcohol to: <ul style="list-style-type: none"> ● Men: <2 drinks daily 	-4 mm Hg	-3 mm Hg

Review Article

Sleep, insomnia, and hypertension: current findings
and future directions

S. Justin Thomas, PhD^{a,*} and David Calhoun, MD^b

^a*Department of Epidemiology, University of Alabama at Birmingham, Birmingham, AL, USA; and*

^b*Department of Medicine, Division of Cardiovascular Disease, University of Alabama at Birmingham, Birmingham, AL, USA*

Manuscript received October 10, 2016 and accepted November 26, 2016

Reported associations between insomnia and hypertension have been inconsistent.

Insomnia combined with a short sleep duration (<5 hours, but not > 5 hours) is associated with a significantly increased risk of hypertension.

Nurses Health Study

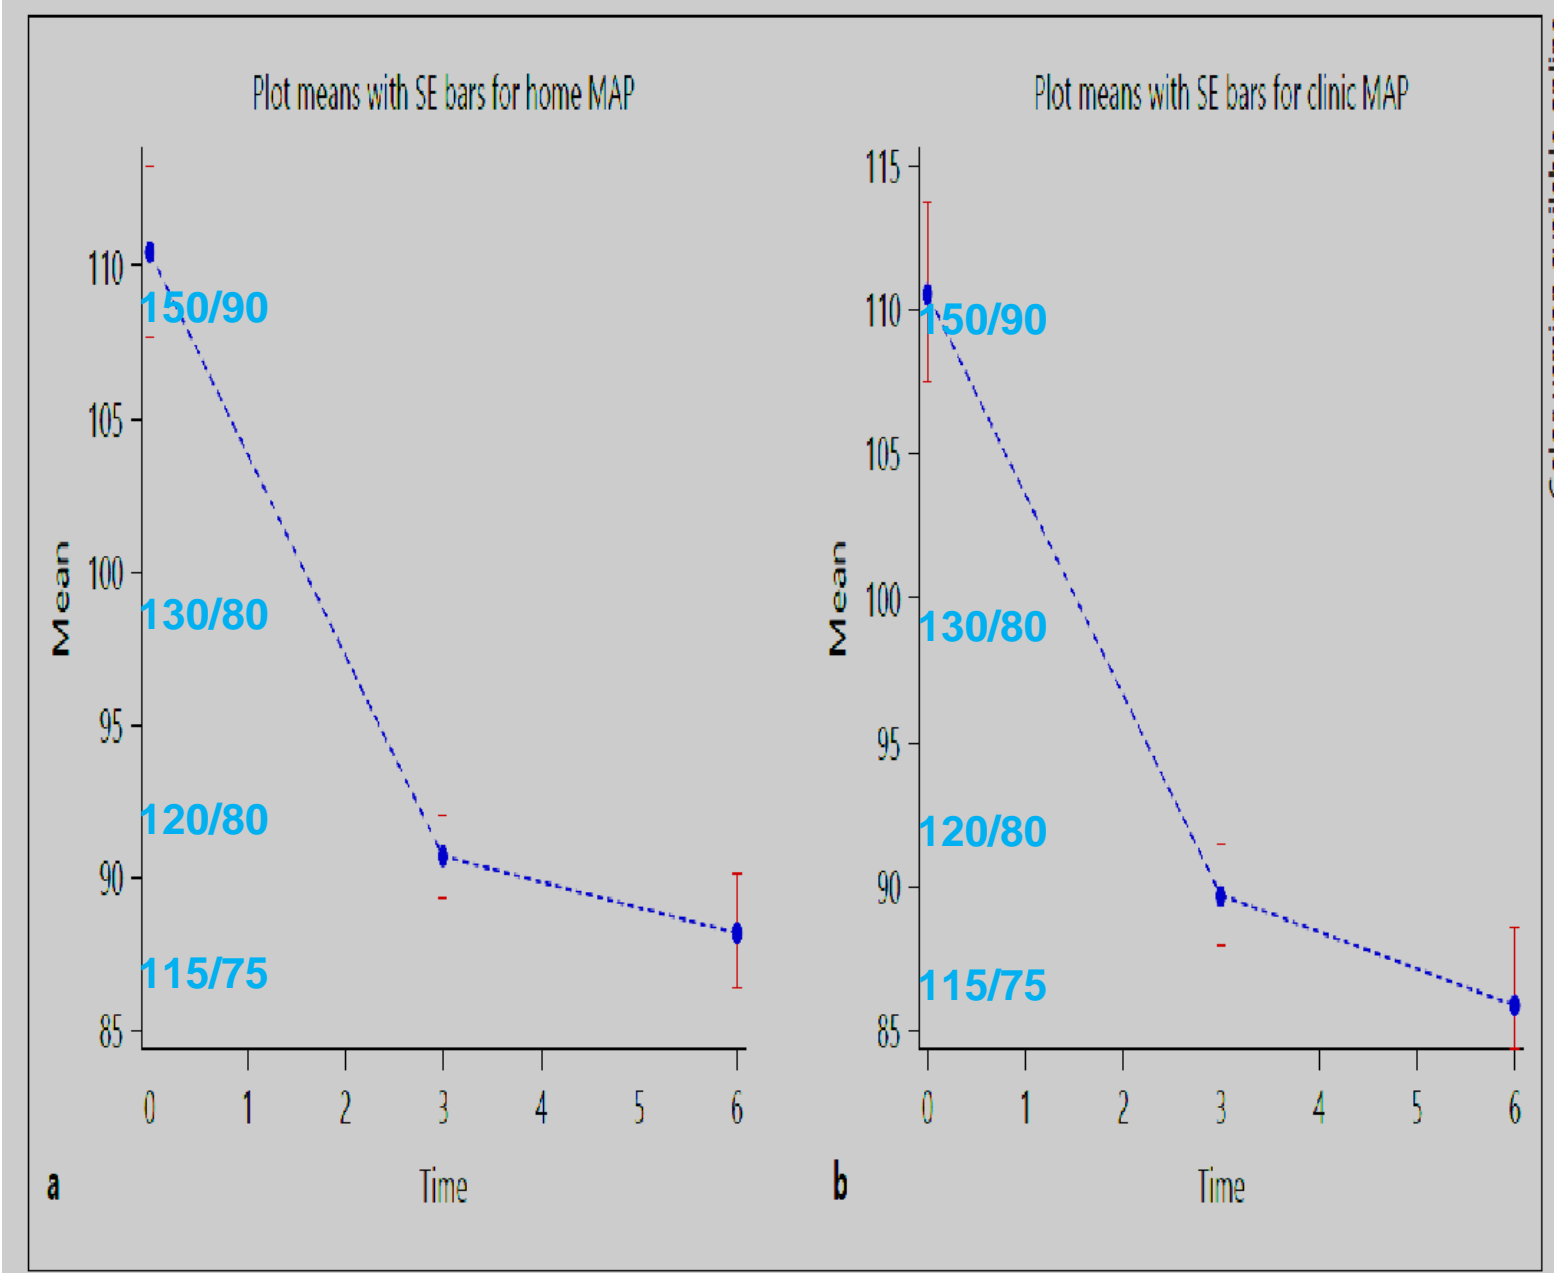

71,617 women 45-65 years

10-year follow-up of Incident CHD

Sleep Duration	Relative Risk	Confidence Interval
5 hours	1.82	1.34 – 2.41
6 hours	1.30	1.08 – 1.57
7 hours	1.06	0.89 – 1.26
8 hours	1	1

BP Change after Months of Restored Sleep Duration

BLOCK-CKD Eligibility Criteria

			Albuminuria categories (mg albumin/g creatinine)		
			A1 Normal to mildly elevated	A2 Moderately elevated	A3 Severely elevated
			0-29	30-299	≥300-4999
GFR categories (mL/min/1.73 m ²)	G1	>90			
	G2	60–89			
	G3a	45–59			
	G3b	30–44			
	G4	15–29			
	G5	<15			

Key inclusion criteria*

- Stage 3b/4 CKD: eGFR 15-44
- Aged 18-85 and uncontrolled HTN
- SBP 140-179 mm Hg despite on 2+ anti-HTN medication
- Serum potassium ≤4.8 mmol/L

Key exclusion criteria

- Current MRA therapy
- Resting trough-cuff seated SBP ≥ 180 or < 140 mmHg
- Serum potassium > 4.8 mmol/L
- Chronic or intermittent potassium binders

* This study population cannot receive spironolactone or eplerenone due to contra-indications in the package insert

Effects of endothelin receptor antagonists on systolic and diastolic ambulatory blood pressure versus placebo

24-hours SBP

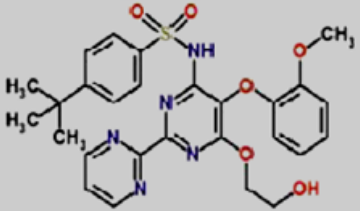

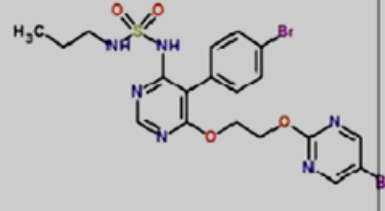

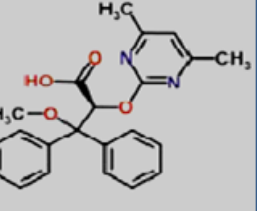

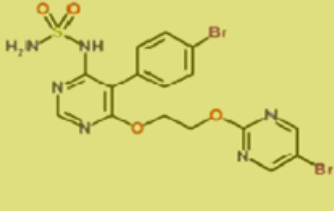

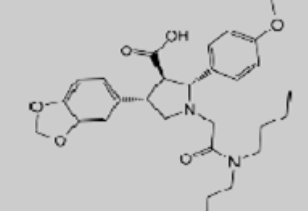

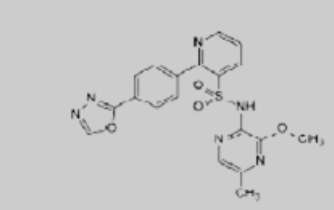

24-hours DBP

Aprocitentan is a dual endothelin-receptor antagonist (ERA), with a 1:16 inhibitory ratio of ETA:ETB

Pharmacological characteristics of endothelin receptor antagonists on the market or still under investigations.

	Bosentan	Macitentan	Ambrisentan	Aprocitentan (ACT-132577)	Atrasentan	Zibotentan
Structure						
Official or target indication	PAH	PAH	PAH	Resistant hypertension	Diabetic nephropathy	Sclerodermia
Time to max concentration (hours)	3-5	4-12	1.7-3.3	30	0.8	1
Terminal half life (hours)	5.4	16	15	40.2-65.6	26.4	8.17
Excretion in urine (%)	<3%	50%	low	Not detected	<10%	93
ET _A selectivity	20	782	616	61	>1000	>1000

PRECISION trial (ClinicalTrials.gov Identifier: NCT03541174)

Purpose: Evaluate blood pressure-lowering effect of ***aprocitentan*** (dual ETA/ETB) blockers when added to other antihypertensive drugs of patients with resistant hypertension

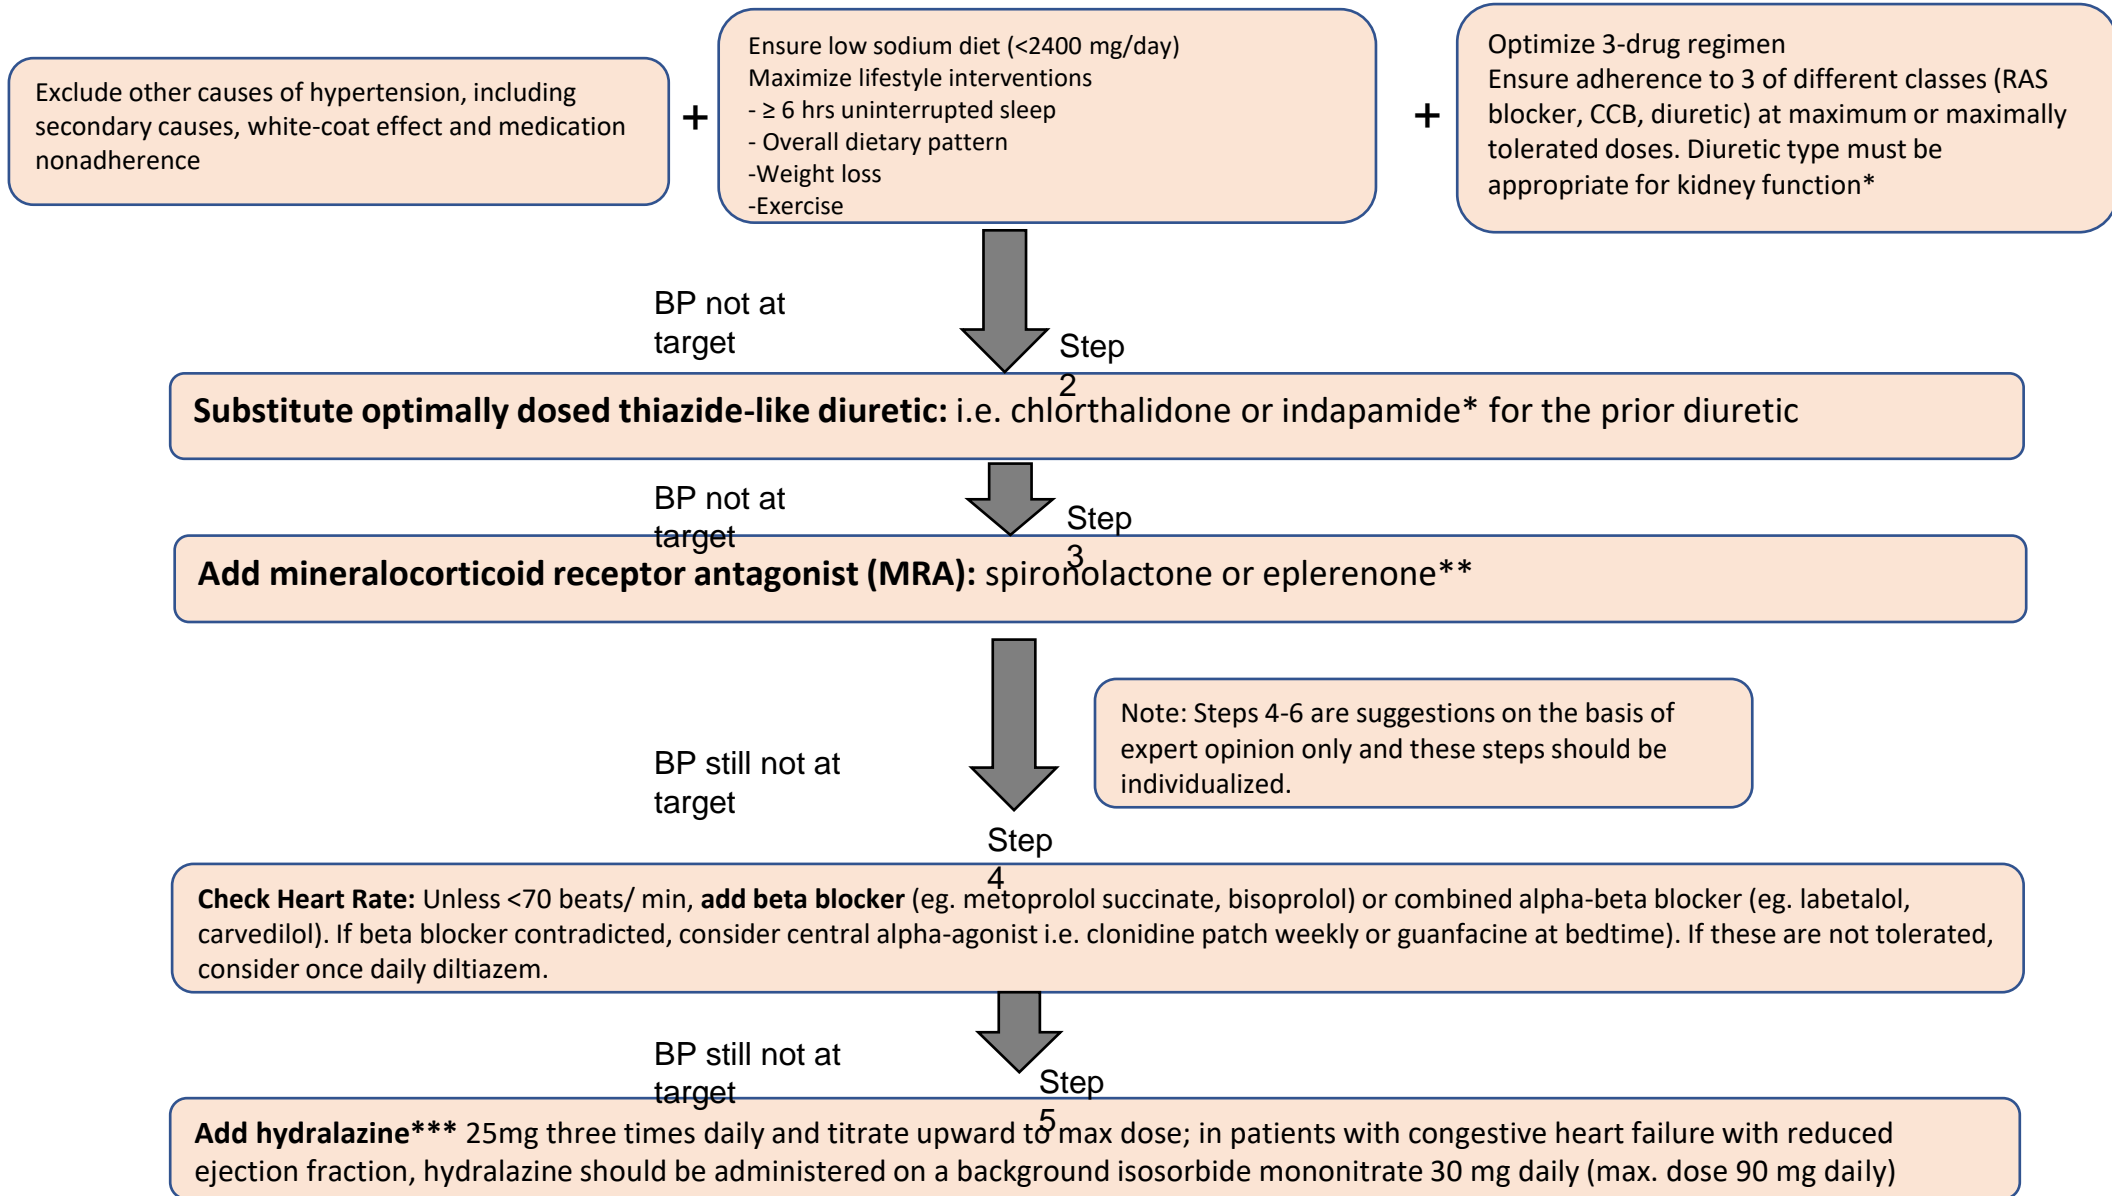

Design Multicenter, blinded, placebo run in, randomized, parallel-group, phase 3 study

Allocation: It has 3 parts: **Part 1:** double-blind, randomized to aprocitentan 12.5 mg, aprocitentan 25 mg or placebo **Part 2:** single blind aprocitentan 25 mg **Part 3:** double-blind re-randomized to aprocitentan 25 mg or placebo Masking: triple (participant, care provider, investigator)

Estimated enrollment 600 participants treated with at least 3 antihypertensive therapies of different pharmacological classes for at least 4 weeks before the screening visit

Primary outcome - *Change from baseline to week 4 of double-blind treatment in trough sitting systolic blood pressure*

MANAGEMENT OF RESISTANT HYPERTENSION

BP still not at target

Step
6

Substitute minoxidil**** 2.5mg two to three times daily for hydralazine and titrate upward. If BP still not at target, consider referral to a hypertension specialist and/or for ongoing experimental studies- www.clinicaltrials.gov

- * These diuretics maintain efficacy down to estimated glomerular filtrations rates of 30ml/min/1.73m²
- ** Use caution if eGFR<30 ml/min/1.73m²
- *** Require concomitant use of beta blocker and a diuretic
- **** Require the concomitant use of a beta blocker and a loop diuretic

Alternative Nonpharmacologic Therapies

- Renal Denervation

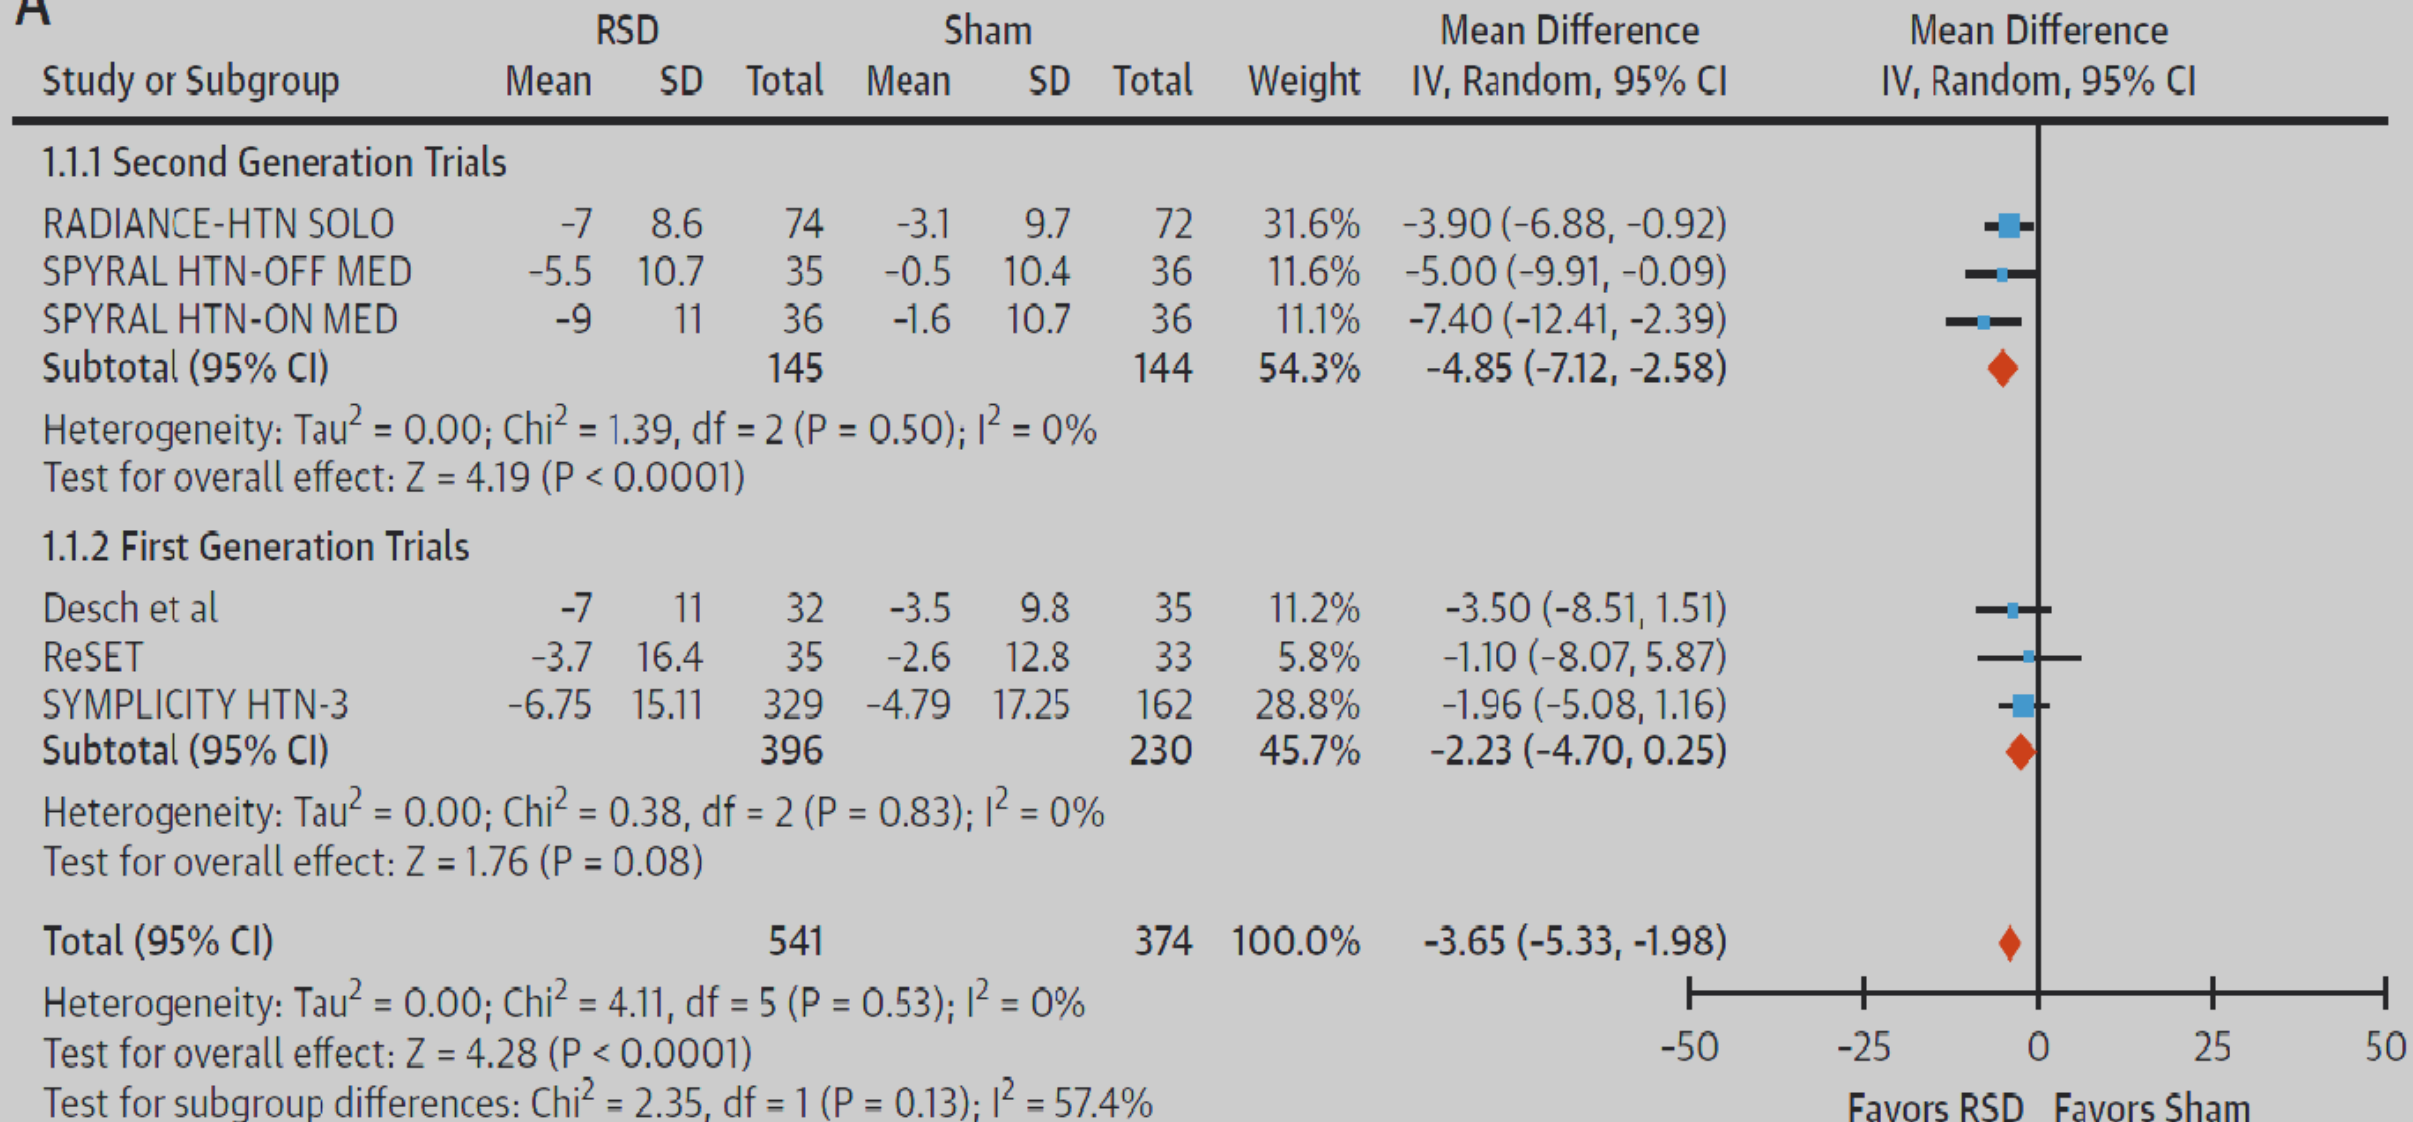

Approved in parts of Europe

- Baroreceptor Activation

Approved for Heart Failure in parts of Europe

24-h Ambulatory Systolic Blood Pressure Changes With RSD Versus Sham-Controlled Group

A

Summary

- Updated Hypertension Guidelines continue to emphasize **combination therapy** and **adherence with drugs and lifestyle**.
- For now, Think of spironolactone as 4th drug after diuretics, CCB and RAS blocker in people with eGFR above 45 ml/min /1.73m² who are at lower risk of hyperkalemia.
- Remember there is a range of efficacy **within certain drug classes**
