USE OF GLUCOSE-LOWERING MEDICATIONS IN THE MANAGEMENT OF TYPE 2 DIABETES

HEALTHY LIFESTYLE BEHAVIORS; DIABETES SELF-MANAGEMENT EDUCATION AND SUPPORT (DSMES); SOCIAL DETERMINANTS OF HEALTH (SDOH)

* In people with HF, CKD, established CVD or multiple risk factors for CVD, the decision to use a GLP-1 RA or SGLT2i with proven benefit should be independent of background use of metformin; † A strong recommendation is warranted for people with CVD and a weaker recommendation for those with indicators of high CV risk. Moreover, a higher absolute risk reduction and thus lower numbers needed to treat are seen at higher levels of baseline risk and should be factored into the shared decision-making process. See text for details; ^ Low-dose TZD may be better tolerated and similarly effective; § For SGLT2i, CV/ renal outcomes trials demonstrate their efficacy in reducing the risk of composite MACE, CV death, all-cause mortality, MI, HHF, and renal outcomes in individuals with T2D with established/high risk of CVD; # For GLP-1 RA, CVOTs demonstrate their efficacy in reducing composite MACE, CV death, all-cause mortality, MI, stroke, and renal endpoints in individuals with T2D with established/high risk of CVD;

Identify barriers to goals:

- · Consider DSMES referral to support self-efficacy in achievement of goals
- · Consider technology (e.g., diagnostic CGM) to identify therapeutic gaps and tailor therapy
- Identify and address SDOH that impact achievement of goals

Non-Steroidal MRAs in CKD: Rationale, Data, and Interpretation

FIDELIO-DKD RATIONALE High Residual Risk Of CKD Progression With Current Therapies

1. Alicic RZ, et al. Clin J Am Soc Nephrol 2017;12:2032; 2. Mora-Fernández C, et al. J Physiol 2014;18:3997; 3. Perkovic V. et al. N Engl J Med 2019:380:2295

MR overactivation is a major driver of kidney damage

Mineralocorticoid receptors

regulate gene expression through co-factor recruitment¹

In renal disease, multiple factors overactivate the MR

including aldosterone, Rac1, cortisol and others^{2,3}

Overactivation of the MR signalling pathway drives inflammation and fibrosis

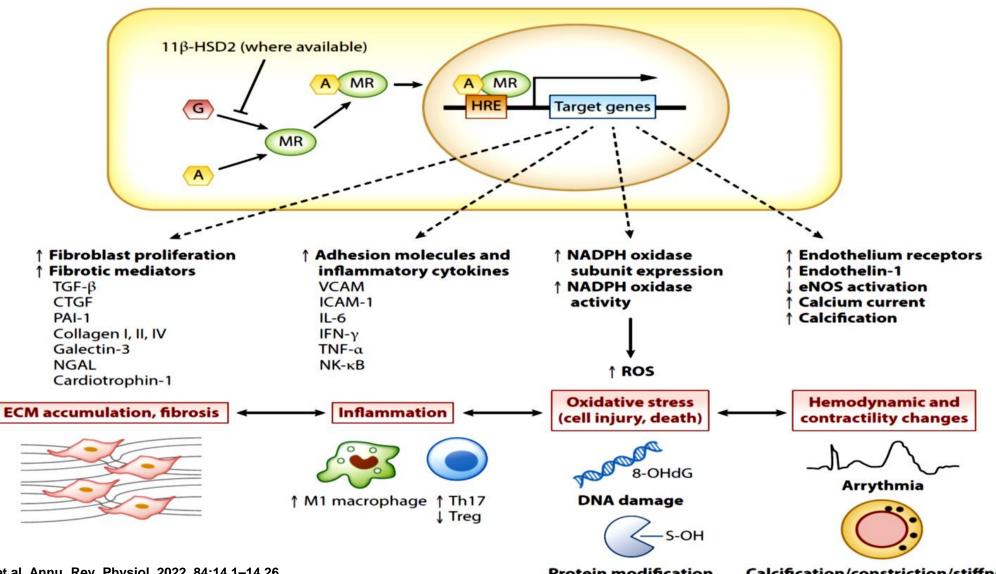

via pro-inflammatory cytokines and fibrotic proteins, e.g. TNF- α , IL-1b and IL- $6^{1,2}$

MR overactivation results in deleterious effects on the heart and kidney, promoting cardiac remodelling and progression of both renal and cardiovascular disease²

MR, mineralocorticoid receptor; IL-1b, interleukin-1b; IL-6, interleukin-6; TNF-α, tumour necrosis factor alpha; Rac1, Ras-related C3 botulinum toxin substrate 1

1. Ong GS & Young MJ. J Mol Endocrinol 2017;58:33–57; 2. Bauersachs J, et al. Hypertension 2015;65:257–263; 3. Bertocchio JP, et al. Kidney Int 2011;79:1051–1060

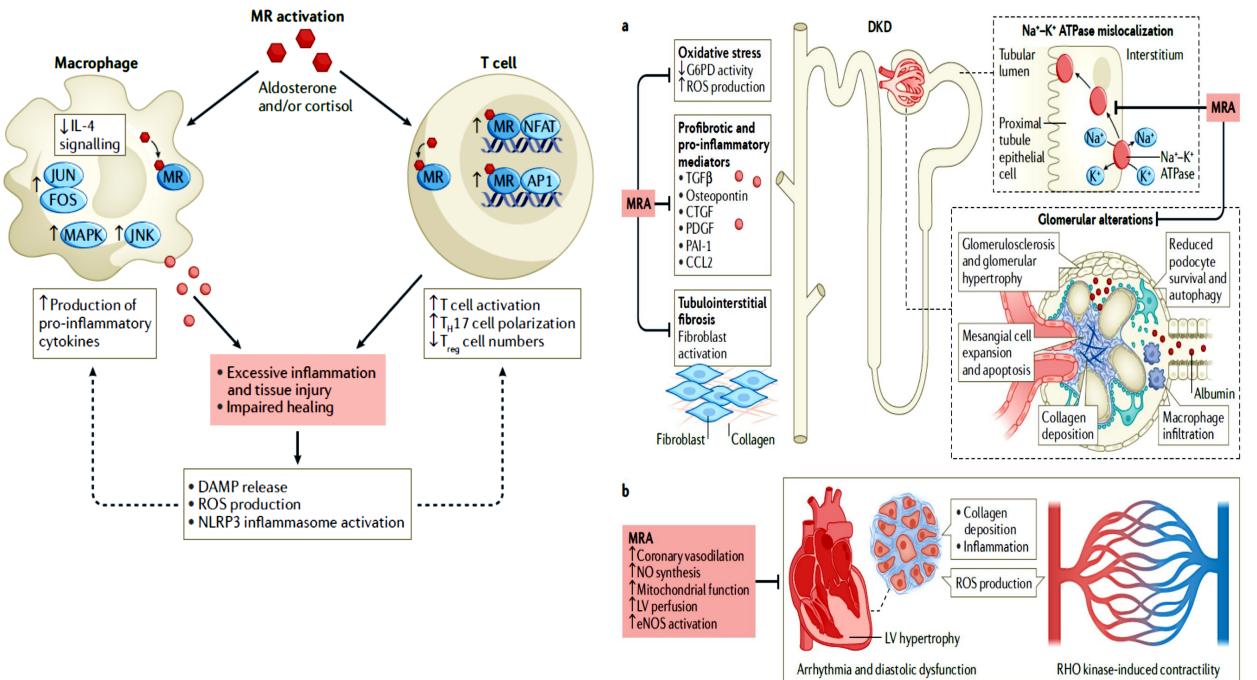

Summary of the pathological mechanisms elicited by MR activation. MR activation by aldosterone (A) or glucocorticoids (G) induces the expression of several genes

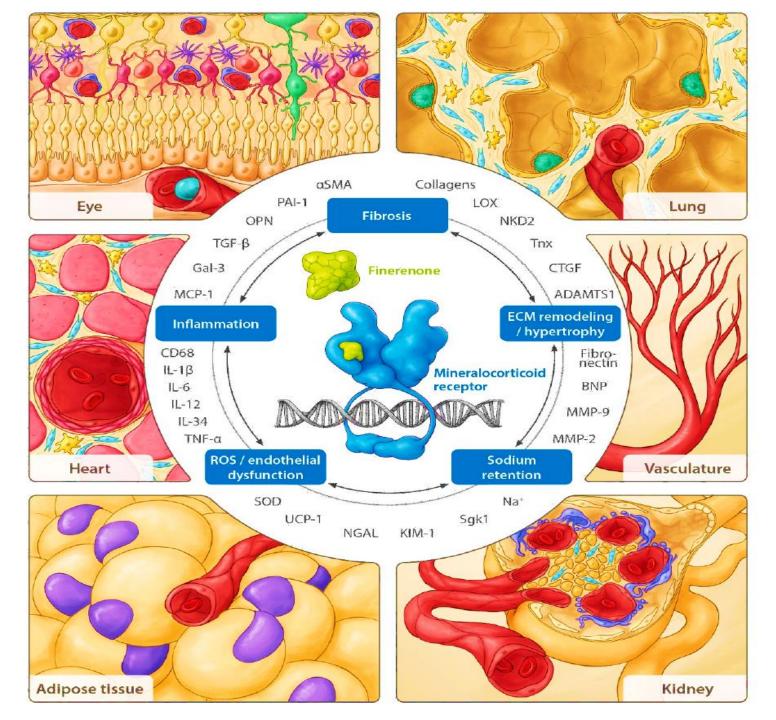

Barrera-Chimel et.al. Annu. Rev. Physiol. 2022. 84:14.1–14.26

Protein modification

Calcification/constriction/stiffness

Barrera-Chimal J, Lima-Posada I, Bakris GL, Jaisser F. Nat Rev Nephrol 2021.

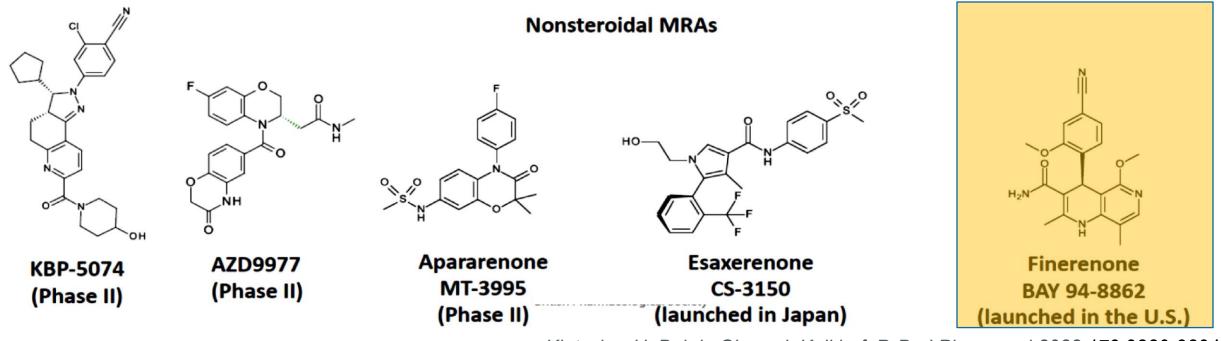

Components of pathophysiological MR veractivation that are counteracted by inerenone in different organs and cell types, including relevant biomarkers

Kolkhof P, et.al. and Bakris GL Int. J. Mol. Sci. 2022, 23, 9243

TWO DIFFERENT CLASSES OF AGENTS THAT INHIBIT THE MR

Steroidal MRAs
(Aldosterone Antagonists)(H) = (H) + (H)

What About The Combination of an SGLT2 inhibitor and Finerenone on Outcomes

Preclinical data show that combination therapy with finerenone and an SGLT-2i has benefits over monotherapy*

Low-dose combination tended to have more anti-fibrotic effects than each low dose monotherapy

Greatest survival benefit observed with combined treatment of finerenone and empagliflozin

*CV morbidity and mortality studied in hypertensive, N(ω)-nitro-L-arginine methyl ester-treated, renin-transgenic (mRen2)27 rats; *cardiac fibrosis determined by Sirius Red/Fast Green staining; [‡]proportion of survival defined as the absence of mortality and severe morbidity per group over the course of the study; [§]combination therapy of finerenone (1 mg/kg) and empagliflozin (3 mg/kg) Data are mean±SEM. SEM, standard error of the mean

CV, cardiovascular; SEM, standard error of the mean; SGLT-2i, sodium-glucose co-transporter-2 inhibitor

Kolkhof P et al. Am J Nephrol. 2021; 52(8):642-652

The FLOW trial: Effect of semaglutide versus placebo on the progression of renal impairment in subjects with type 2 diabetes and chronic kidney disease

The FLOW trial

Objectives

Primary

To demonstrate that semaglutide delays the progression of renal impairment, and lowers the risk of renal and CV mortality in subjects with T2D and CKD

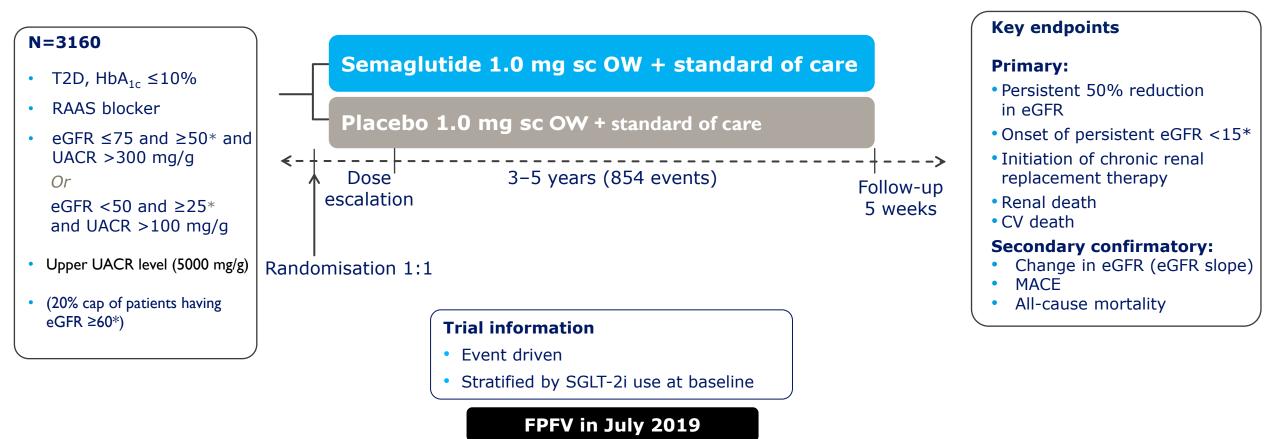

Secondary

To compare the effect of semaglutide versus placebo in subjects with T2D and CKD with regards to Cardiovascular morbidity, peripheral artery disease, glycaemic control, body weight, blood pressure, and safety.

TRIAL DESIGN

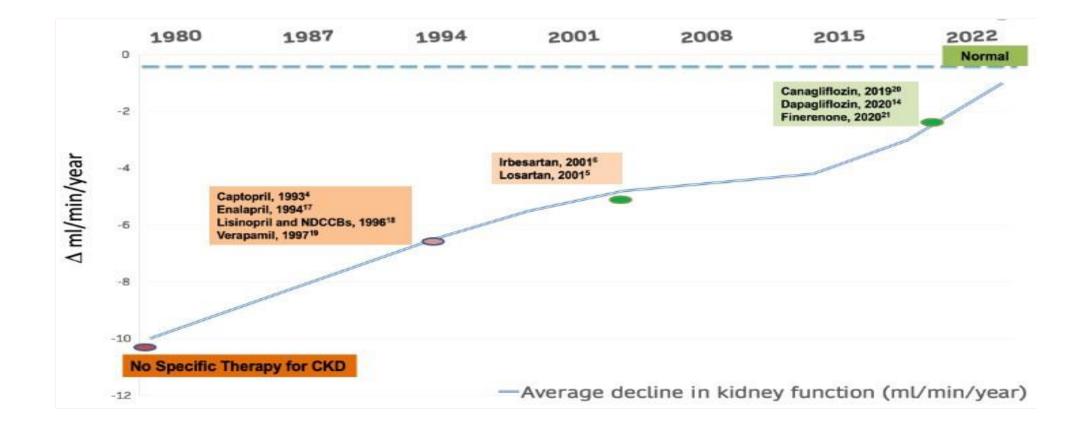

FLOW trial

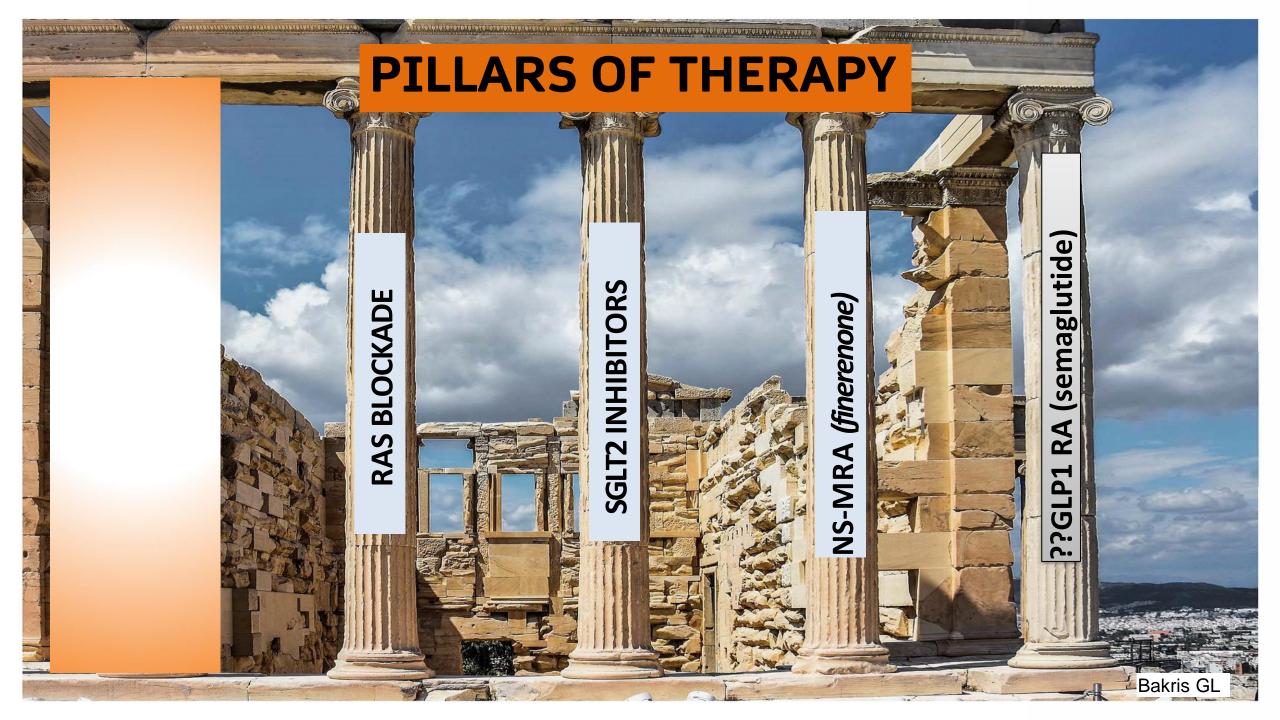

*(mL/min/1.73 m²)

CV, cardiovascular; eGFR, estimated glomerular filtration rate; MACE, major adverse cardiovascular events; RAAS, renin–angiotensin aldosterone system (maximum labelled or tolerated dose); UACR, urinary albumin-creatinine ratio sc, subcutaneous; SGLT-2i, sodium glucose transporter-2 inhibitor, T2D, type 2 diabetes NCT03819153. ClinicalTrials.gov. Last accessed March 2019

History of Successful Intervention to Slow GFR Decline

Naaman SC, Bakris GL. Chronic Kidney Disease and Type 2 Diabetes. Arlington (VA), 2021:28-32.

Key point summary

- Reduction of CKD progression and subsequent CVD risk, primarily heart failure hospitalizations, now have 2 additional agents to supplement RAS blocking use.
- Maximizing newer approaches to CKD risk reduction (with maximally tolerated background therapy) demonstrate additional slowing of DKD progression to a little less than 2.5-3 ml/min/year-Normal decline is 0.8 ml/min/year
- Additional trial data will be forthcoming over the next two years with GLP1-RAs to further extend these findings in advanced CKD.
